Team Working Agreement

AGENTMESH – one request, many minds – orchestrated.

1. Why We're Building This

We're building the AI Agent Orchestration Platform to let multiple specialized AI agents work together on complex tasks instead of relying on one general-purpose model. Our aim as a team is to ship a working MVP with a functioning Orchestrator, an Agent Registry, and support for sequential, parallel, and conditional workflows — all while holding ourselves to a high engineering and academic bar.

2. Who Owns What

- Scrum Manager — runs meetings, keeps the backlog and tracker current, keeps milestones on schedule.
- Technical / Orchestrator Lead — owns the system architecture and the core logic behind task decomposition and agent selection; steps in on technical disagreements.
- Frontend Lead — builds the React/Next.js interface, the workflow visualization, and connects it to the backend.
- Backend & Cloud Lead — builds the API Gateway and backend services, manages the database, and handles data security.
- Agent & LLM Integration Lead — maintains the Agent Registry, the multi-provider model interface, and the contracts agents use to pass data to each other.
- Documentation & QA Lead — keeps documentation current and owns our testing and evaluation approach.

3. How We Communicate

- Tools: Discord/Outlook for technical discussion, WhatsApp for fast updates, Zoom for meetings, GitHub for code, GitHub Wiki for docs.
- Everyone's input matters. Any significant change of direction gets raised in WhatsApp first and needs group sign-off before it happens.
- When we disagree: each side brings a researched case for their approach, then the team votes and goes with the majority.

4. Meetings & Cadence

- We meet twice a week – Wednesday and Friday @ 8PM EST on Google meet. Async updates daily in the team channel. We might reschedule it to other dates but you have to inform the team beforehand.
- Every meeting runs off a shared agenda so people can come prepared.
- Can't make it? Flag it in the group chat beforehand — we'll record the session so you can catch up.
- Each sprint kicks off with a planning session and wraps with a retro at the final meeting.

5. How We Work Together

- Work gets split evenly across orchestration logic, agent integrations, frontend, backend, and docs; anything large gets broken into smaller pieces.
- Stuck on something? Try to work through it yourself first and jot down what you've already tried — it makes it faster for the team to help.
- Everyone keeps the tracker up to date and links their work back to the relevant commits or docs.
- We treat each other with patience and respect, full stop.

6. Git & GitHub Practices

- Post in WhatsApp before pushing so we don't step on each other's changes.
- If a change touches someone else's area (Orchestrator, Agent Registry, frontend, API Gateway, etc.), talk it through with them first.
- Nothing gets pushed straight to main — all work happens on branches and merges in through a PR with at least one approval.

7. What "Done" Actually Means

Before anything is marked complete, it needs to check every box below:

- Runs cleanly, no syntax or runtime errors.
- Reviewed and tested by whoever built it.
- Pushed to GitHub with a PR open.
- Docs updated and tagged alongside the code.
- Looked over and confirmed working by at least one other teammate.
- Passes every test case we defined, including schema checks on agent outputs where relevant.

Team Roster

Name	GitHub Username	GitHub Profile
Dhwani Dobariya	DhwaniDobariya	https://github.com/DhwaniDobariya
Aniruddha Rath	AniRath020697	https://github.com/AniRath020697
